

## General policy on information security issues

Technolution supports its clients by implementing solutions for complex technological issues with demanding conditions. Technolution delivers working solutions in which electronics, programmable logic and software are seamlessly connected, which are often groundbreaking and make an essential contribution to realizing its clients' objectives.

As a knowledge-intensive organization, Technolution in carrying out its activities deals with information of diverse types and origins. We are seeing that society around us is becoming increasingly concerned about the possibility that information is being used or might be used illegitimately.

Technolution as an organization is convinced that working on the basis of trust enhances the quality and speed of service. At the same time, however, Technolution takes great care in dealing with information.

Technolution is also committed to using its innovative capabilities to develop new technologies and concepts for information security. Anticipating societal trends and regulations is an integral part of this.

In order to safeguard these objectives permanently, Technolution has adopted an information security management system in accordance with ISO27001. Within the framework of our operations, the policy aims at:

- treating information carefully without losing the speed that comes with trust;
- acting responsibly, so that information is used only for the purposes it is intended for;
- developing and applying innovative methods/applications to further information security;
- anticipating and complying with the demands both of laws and regulations, and of the domains in which Technolution operates.

The information security management system's objectives are evaluated and updated on an annual basis. In this way, Technolution gives tangible effect to measures in the field of information security, while constantly improving the information security management system and keeping it up to date.
